Population health profile
of the Flinders and Far North Division of General Practice: supplement

This profile is a supplement to the Population health profile of the Flinders and Far North Division of General Practice, dated November 2005, available from www.publichealth.gov.au. This supplement includes an update of the population of the Flinders and Far North Division of General Practice, as well as additional indicators and aspects of the Division’s socioeconomic status, use of GP services and health. The contents are:

- Population [updated to June 2005]
- Additional socio-demographic indicators
- Unreferred attendances – patient flow/ GP catchment
- Additional prevalence estimates: chronic diseases and risk factors combined
- Avoidable hospitalisations: hospital admissions resulting from ambulatory care sensitive conditions
- Avoidable mortality

For further information on the way Division totals in this report have been estimated, please refer to the ‘Notes on the data’ section of the Population health profile, November 2005 (www.publichealth.gov.au).

Population

The Flinders and Far North Division had an Estimated Resident Population of 25,977 at 30 June 2005.

Figure 1: Annual population change, Flinders and Far North DGP, country South Australia, South Australia and Australia, 1991 to 1996, 1996 to 2001 and 2001 to 2005

Over the five years from 1991 to 1996, there was a 0.9% decline in the Division’s population, compared with small increases in country South Australia (0.3%) and South Australia (0.4%). From 1996 to 2001, the Division’s population again declined, by 0.1%, compared to increases in country South Australia (0.4%) and South Australia (0.6%). The Division’s rate of decline at 1.1% per year on average from 2001 to 2005 was in contrast to the annual increases for country South Australia (0.5%) and South Australia (0.4%).

</table>

As shown in the accompanying table and the age-sex pyramid (Figure 2), the Flinders and Far North DGP had a higher proportion of the population at ages 0 to 14 years (22.5%) compared to Australia as a whole (with 19.6%) and 25 to 44 years (29.8%, compared to 28.9% for Australia) (Table 1). At other ages the proportions of the Division’s population were lower than for Australia.
The most notable differences in the age distribution of the Division’s population (when compared to Australia overall) are:

- at younger ages – higher proportions of male and female children aged 0 to 14 years;
- from 15 to 24 years – lower proportions of both males and females;
- from 25 to 49 years – slightly higher proportions of males and females (25 to 39 years); and
- from 60 years and over – slightly higher proportions of males and females.

The population projections for the Division show a number of changes in age distribution, with the 2020 population projected to have:

- at younger ages – lower proportions of children, young people and young adults aged 0 to 24 years;
- from 30 to 49 years – lower proportions of both males and females; and
- from 55 years onwards – higher proportions, particularly between 55 and 74 years, of both males and females.

Additional socio-demographic indicators

One of four socioeconomic indexes for areas produced at the 2001 ABS Census is the Index of Relative Socio-Economic Disadvantage.

The Flinders and Far North DGP has an index score of 958, below the score for Australia of 1000: this score varies across the Division, from a low of 831 in the most disadvantaged areas to 1047 in the least disadvantaged areas.

Note: each ‘quintile’ comprises approximately 20% of the population of the Division.

A new indicator, produced for the first time at the 2001 ABS Census, shows the number of jobless families with children under 15 years of age. There were markedly more jobless families in the Flinders & Far North DGP (21.0%), compared to country South Australia as a whole (17.5%) (Figure 5, Table 2).

With the introduction of the 30% rebate for private health insurance premiums, there was a once-off registration process, providing information of the postcode and residence of those who had such insurance (these data are not available at this area level for later dates). In 2001, the Division had markedly fewer people with private health insurance (34.1%), compared to country South Australia (43.5%) (Figure 5, Table 2).

The following tables include information, purchased from Medicare Australia, of the movement of patients and GPs between Divisions. Note that the data only include unreferred attendances recorded under Medicare: unreferred attendances not included are those for which the cost is met by the Department of Veterans’ Affairs or a compensation scheme; or are provided by salaried medical officers in hospitals, community health services or Aboriginal Medical Services, and which are not billed to Medicare. At any attendance, one or more services may have been provided.

The majority (89.7%) of GP unreferred attendances to residents of Flinders and Far North DGP were provided in the Division (ie. by a GP with a provider number in the Division): this represented 116,827 GP unreferred attendances (Table 3). A further 1.6% of unreferred attendances were provided by GPs with a provider number in Eyre Peninsula DGP, with 1.3% by GPs in Adelaide Central and Eastern DGP.

Additional prevalence estimates: chronic diseases and risk factors combined: Pt Augusta (part of Flinders and Far North DGP)

Please refer to the earlier *Population health profile of the Flinders and Far North Division of General Practice*, dated November 2005, available from [www.publichealth.gov.au](http://www.publichealth.gov.au), for the separate prevalence estimates of chronic disease; measures of self-reported health and risk factors. The process by which the estimates have been made, and details of their limitations, are also described in the ‘Notes on the data’ section of this earlier profile.

In this section two estimates, which combine the prevalence of selected chronic diseases with a risk factor, are shown for the SLA of Port Augusta, which comprises approximately 50.0% of the Division’s population. The estimates have not been made for the whole Division as only this SLA was included in the National Health Survey. The measures are of people who had asthma and were smokers, and people who had type 2 diabetes and were overweight or obese: note that the estimates have been predicted from self-reported data, and are not based on clinical records or physical measures.

It is estimated that there were relatively more people in Port Augusta SLA who had asthma and were smokers, compared to country South Australia or Australia as a whole (Figure 6, Table 5): that is, the prevalence rates per 1,000 population were higher. Similarly, there was a higher rate of people in Port Augusta SLA who had type 2 diabetes and were overweight/obese, compared to country South Australia (in particular) or Australia.

![Figure 6: Estimates of selected chronic diseases and risk factors, Pt Augusta SLA, country South Australia and Australia, 2001](image)

![Table 5: Estimates of selected chronic diseases and risk factors, Pt Augusta SLA, country South Australia, South Australia and Australia, 2001](table)

1. No. is a weighted estimate of the number of people in Port Augusta SLA reporting these chronic conditions/with these risk factors and is derived from synthetic predictions from the 2001 NHS
2. Rate is the indirectly age-standardised rate per 1,000 population
3. Population aged 18 years and over
4. Population aged 15 years and over
Avoidable hospitalisations: hospital admissions resulting from ambulatory care sensitive conditions

The rationale underlying the concept of avoidable hospitalisations is that timely and effective care of certain conditions, delivered in a primary care setting, can reduce the risk of hospitalisation. Admissions to hospital for these ambulatory care sensitive (ACS) conditions can be avoided in three ways. Firstly, for conditions that are usually preventable through immunisation or nutritional intervention, disease can be prevented almost entirely. Secondly, diseases or conditions that can lead to rapid onset problems, such as dehydration and gastroenteritis, can be treated. Thirdly, chronic conditions, such as congestive heart failure, can be managed to prevent or reduce the severity of acute flare-ups to avoid hospitalisation.

This measure does not include other aspects of avoidable morbidity, namely potentially preventable hospitalisations (hospitalisations resulting from diseases preventable through population based health promotion strategies, e.g. alcohol-related conditions; and most cases of lung cancer) and hospitalisations avoidable through injury prevention (e.g. road traffic accidents).

In 2001 to 2002, the 1,433 admissions from ambulatory care sensitive (ACS) conditions accounted for 11.4% of all hospitalisations in the Flinders and Far North DGP (Table 6, Figure 7), markedly above the levels in South Australia (8.5) and Australia (8.7%).

\(^1\) Admissions resulting from ACS conditions  
\(^2\) Rate is the indirectly age-standardised rate per 100,000 population

The rate of avoidable hospitalisations in Flinders and Far North DGP is substantially higher, a rate of 5,976.9 admissions per 100,000 population, compared to both South Australia (a rate of 2,915.7), and Australia (2,847.5).

Diabetes complications, chronic obstructive pulmonary disease, dental conditions and dehydration and gastroenteritis, were the four conditions with the highest rates of avoidable hospitalisations in the Flinders and Far North DGP (Figure 8, Table 7).

Table 7 shows the number, rate and proportion of avoidable hospitalisations, for the individual ACS conditions, as well as the vaccine-preventable; acute; and chronic sub-categories. The majority of avoidable hospitalisations are attributable to chronic health conditions. The predominance of hospitalisations for chronic conditions in this period can be primarily attributed to the large number of admissions for diabetes complications. Dental conditions, and dehydration and gastroenteritis, have the highest rates of avoidable hospitalisations for the acute conditions.

---

1. Admissions resulting from ACS conditions
2. Rate is the indirectly age-standardised rate per 100,000 population
3. Excludes nutritional deficiencies as less than ten admissions
4. Sub-category and condition numbers and rates do not add to the reported total avoidable admissions: five conditions (influenza & pneumonia, other vaccine preventable, diabetes complications, ruptured appendix and gangrene) are counted in ‘any diagnosis’, so may be included in more than one condition group.
Avoidable and amenable mortality comprises those causes of death that are potentially avoidable at the present time, given available knowledge about social and economic policy impacts, health behaviours, and health care (the latter relating to the subset of amenable causes).

For information on the avoidable and amenable mortality conditions and ICD codes included in the analysis in this section, please refer to the Australian and New Zealand Atlas of Avoidable Mortality, available from www.publichealth.gov.au.

Over three quarters (77.1%) of all deaths in Flinders and Far North DGP at ages 0 to 74 years over the period 1997 to 2001 are considered to be avoidable, higher than the proportion for country South Australia (72.5%) (Table 8). The rate in the Division is markedly higher than that in country South Australia, a differential of 1.36.

Deaths amenable to health care (amenable mortality, a subset of avoidable mortality) accounted for 31.2% of all deaths at ages 0 to 74 years in Flinders and Far North DGP, higher than the 29.8% in country South Australia.

¹ Rate is the indirectly age-standardised rate per 100,000 population

Rates of avoidable mortality were higher for males than for females in each of the comparator areas. Flinders and Far North DGP’s rate of avoidable mortality for males was 389.7 deaths per 100,000 males, higher than the rate of 238.0 for females. Similarly, the rate of amenable mortality for males in the Division was higher, 137.9, compared to 122.0 for females, a rate ratio of 1.13 (Figure 9, Table 9).

1 Rate is the indirectly age-standardised rate per 100,000 population
2 Rate ratio (M:F) is the ratio of male to female rates; rate ratios differing significantly from 1.0 are shown with
   * p <0.05; ** p <0.01

Another way of measuring premature mortality is to calculate the number of years of life lost (YLL), which takes into account the years a person could have expected to live at each age of death based on the average life expectancy at that age.

The numbers of YLL for Flinders and Far North DGP, country South Australia, South Australia and Australia over the observation period are shown in Table 10 by mortality category. However, given the substantial variation in the populations of these areas, a comparison of the proportion of YLL for each area is also shown.

YLL from avoidable mortality accounted for 77.3% of total YLL (0 to 74 years) for Flinders and Far North DGP, higher than the 72.9% for country South Australia. The proportion of YLL from amenable mortality of 30.5% for Flinders and Far North DGP was higher than the 28.9% for country South Australia.

</tbody>
</table>

Years of life lost were calculated using the remaining life expectancy method (this provides an estimate of the average time a person would have lived had he or she not died prematurely). The reference life table was the Coale and Demeny Model Life Table West level 26 female (for both males and females), with the YLL discounted to net present value at a rate of 3 per cent per year.
In each of the areas in Table 11, the majority of avoidable mortality at ages 0 to 74 years occurred in the 65 to 74 year age group (Table 11), with 1,607.2 deaths per 100,000 population in the Flinders and Far North Division. The 45 to 64 year age group accounted for the next highest rate of avoidable death in all of the comparators, with a rate of 464.7 in the Flinders and Far North Division.

1 Rate is the indirectly age-standardised rate per 100,000 population

Table 12 shows the number and age-standardised death rate by selected major condition group and selected causes included in the avoidable mortality classification.

The highest rates of avoidable mortality for the selected major condition groups in the Flinders and Far North DGP were for cardiovascular diseases, a rate of 102.6 deaths per 100,000 population, and cancer, with a rate of 75.4 deaths per 100,000 population (Table 12, Figure 10). For the selected causes within the condition groups, the two major causes of avoidable mortality were ischaemic heart disease and lung cancer, with rates of 73.9 per 100,000 population and 27.2 per 100,000, respectively.

| **Avoidable mortality** | ABS Deaths 1997-2001; data produced in HealthWIZ by Prometheus Information (not available in public release dataset) |

The projected population at June 2020 is based on the 2002 ERP. As such, it is somewhat dated, and does not take into account more recent demographic trends: it is however the only projection series available at the SLA level for the whole of Australia.

Methods

For background information on the additional prevalence estimates presented in this profile, please refer to the ‘Notes on the data’ section of the Population health profile, November 2005 (www.publichealth.gov.au).

Please also refer to the November 2005 profile for information on the data converters.

Mapping

In some Divisions the maps may include a very small part of an SLA which has not been allocated any population; or has a population of less than 100 or has less than 1% of the SLAs total population; or there were less than five cases (i.e. jobless families, people with health insurance): these areas are mapped with a pattern.
Statistical geography of the Flinders and Far North DGP

Statistical Local Areas (SLAs) are defined by the Australian Bureau of Statistics to produce areas for the presentation and analysis of data. In this Division, SLAs are the same as local government areas (LGAs). Unincorporated areas of the State are also SLAs. The Flinders and Far North Division contains all of the SLAs listed in Table 14.

Further developments and updates

When the re-aligned boundaries are released and DoHA have made known their geographic composition, PHIDU will examine the need to revise and re-publish these profiles (*Population health profile*, dated November 2005, and the *Population health profile: supplement*, dated March 2007).
